## A. INSTALLATION SOFTWARE

### I. For Window Server

## Install MySQL

**Summary:** this tutorial shows you step by step how to install MySQL on Windows platform using MySQL Installer. After the tutorial, you will have a MySQL database server and its tools up and running in your system for learning and practicing MySQL.

### *Download MySQL Installer*

If you want to install MySQL on Windows environment, using MySQL installer is the easiest way. MySQL installer provides you with an easy-to-use wizard that helps you to install MySQL with the following components:

- MySQL Server
- All Available Connectors
- MySQL Workbench with Sample Data Models
- MySQL Notifier
- Tools for Excel and Microsoft Visual Studio
- MySQL Sample Databases
- MySQL Documentation
- 

To download MySQL installer, go to the following link <http://dev.mysql.com/downloads/installer/>. There are two files are available. If you are connecting to the internet while installing MySQL, you can choose the online installation version `mysql-installer-web-community.exe`. If you want to install MySQL offline, you can download the `mysql-installer-community.exe` file.

### *Install MySQL via MySQL Installer*

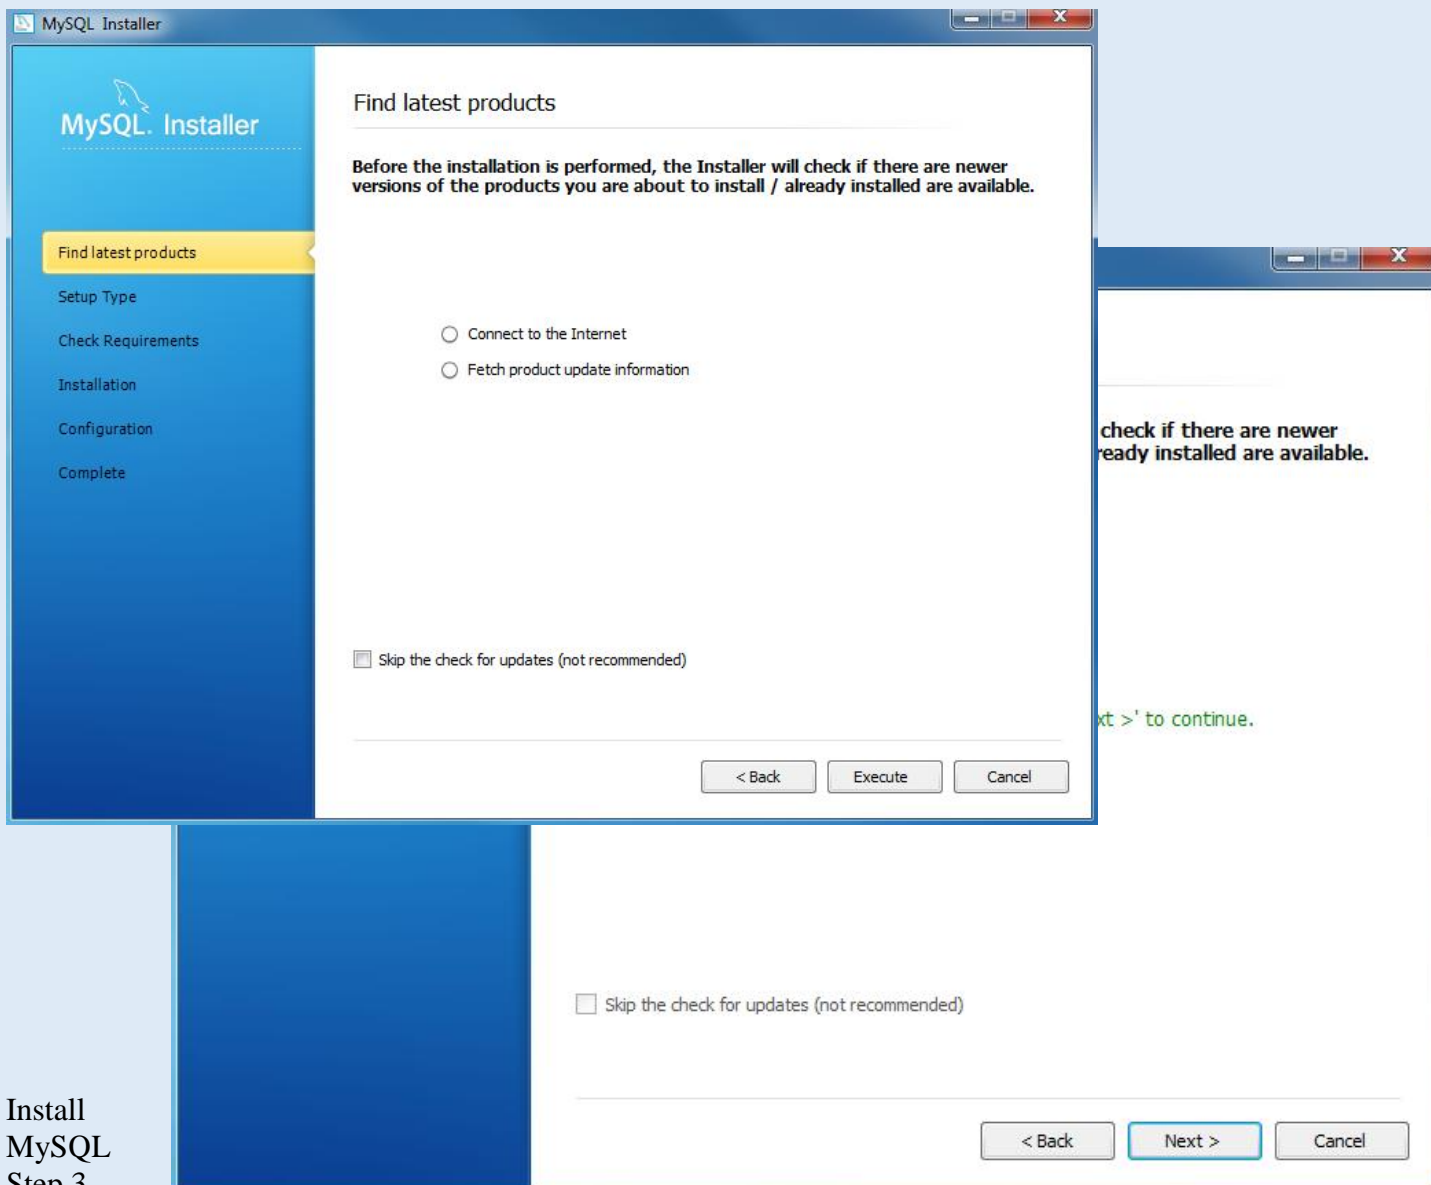

To install MySQL using the MySQL installer, double-click on the MySQL installer file and follow the steps below:

Install MySQL Step 1: Windows configures MySQL Installer

Install MySQL Step 2 – Welcome Screen: A welcome screen provides several options. Choose the first option: Install MySQL Products

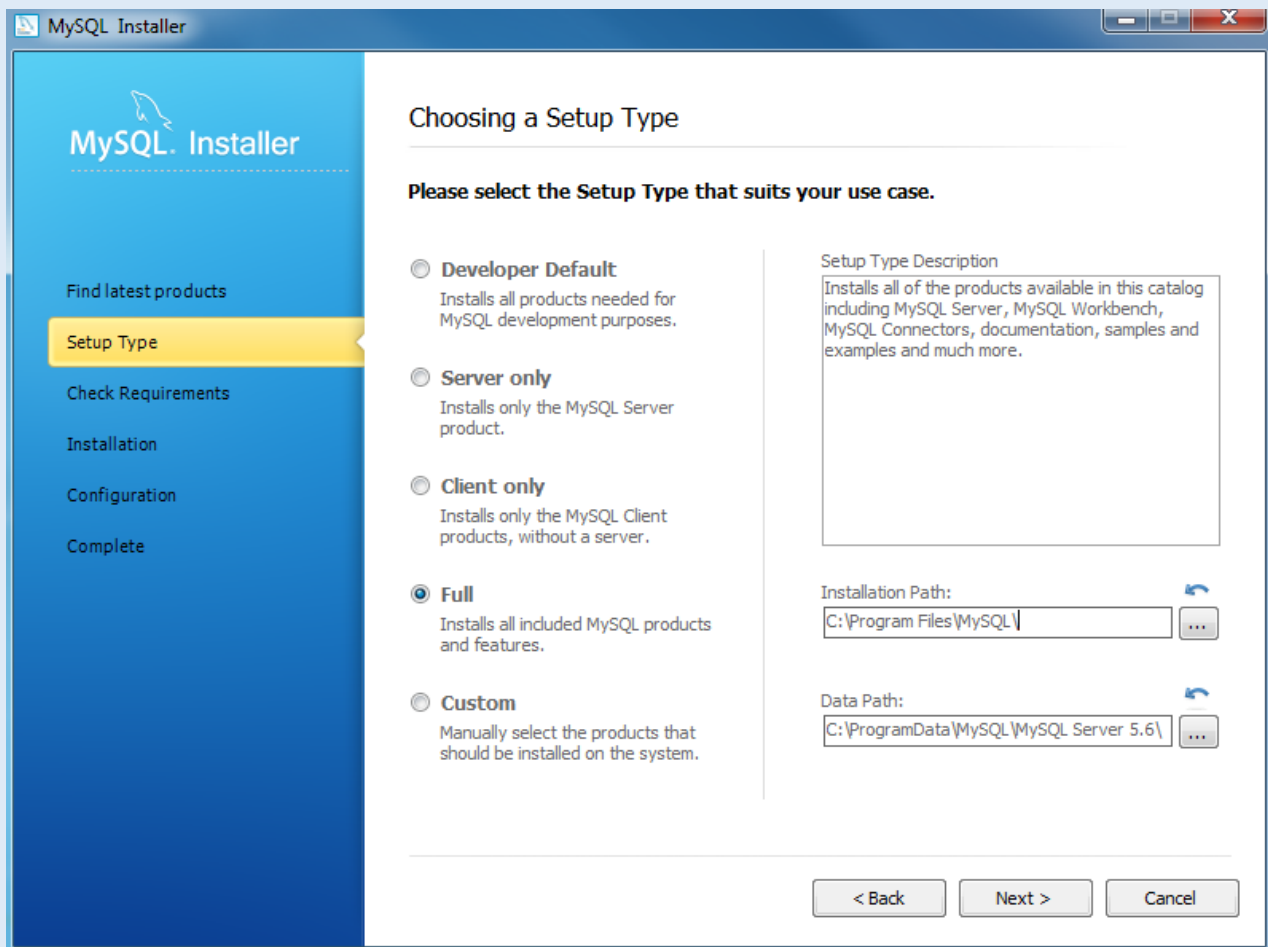

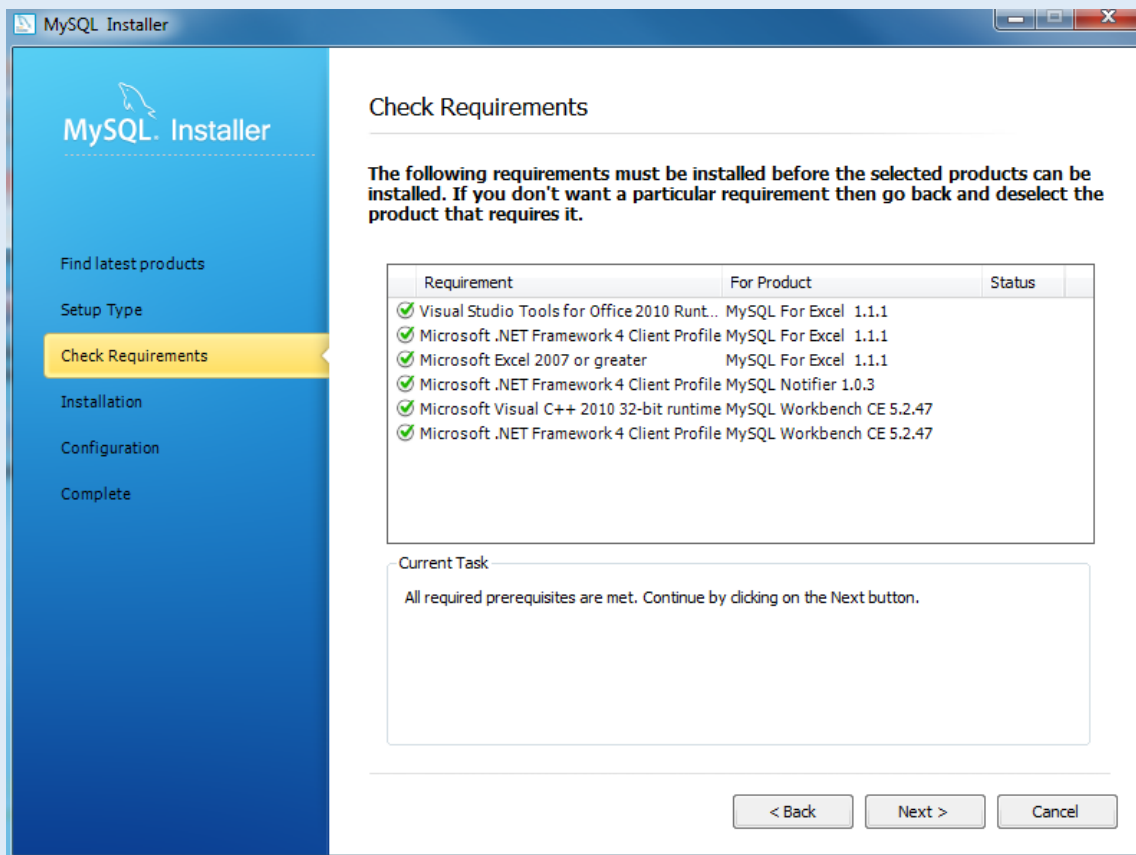

### Install MySQL Step 3 –

Download the latest MySQL products: MySQL installer checks and downloads the latest MySQL products including MySQL server, MySQL Workbench, etc.

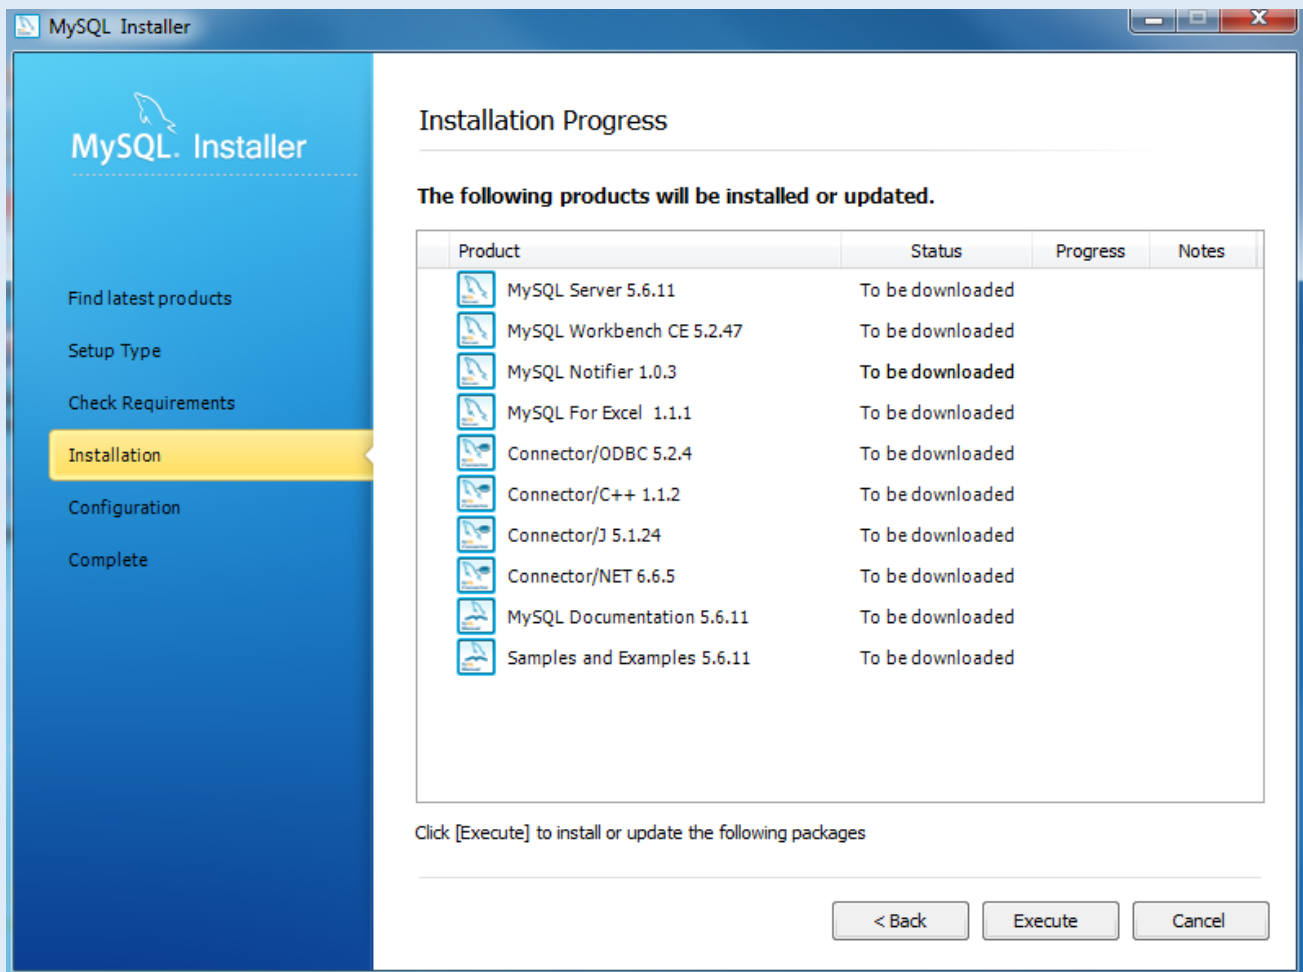

Install MySQL Step 4: Click Next button to continue

Install MySQL Step 5 – Choosing a Setup Type: there are several setup types available. Choose the Full option to install all MySQL products and features.

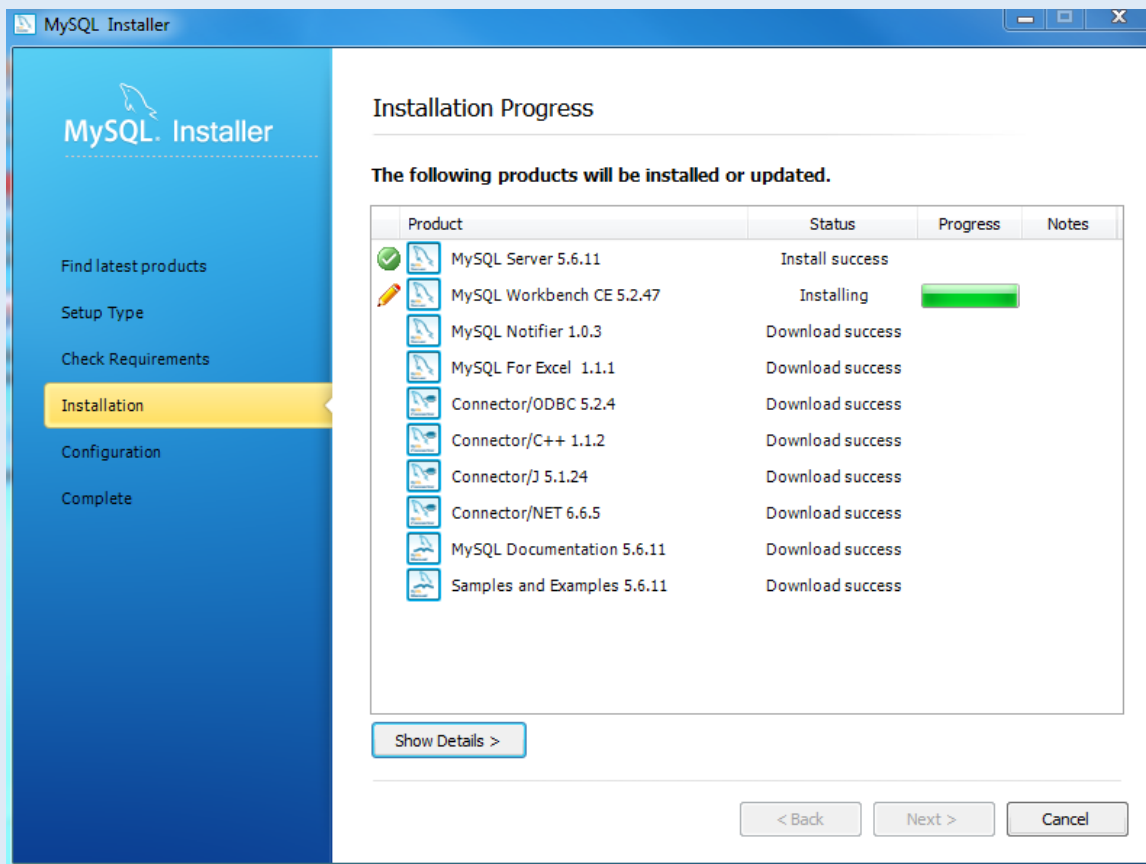

## Install MYSQL Step 6 – Checking Requirements

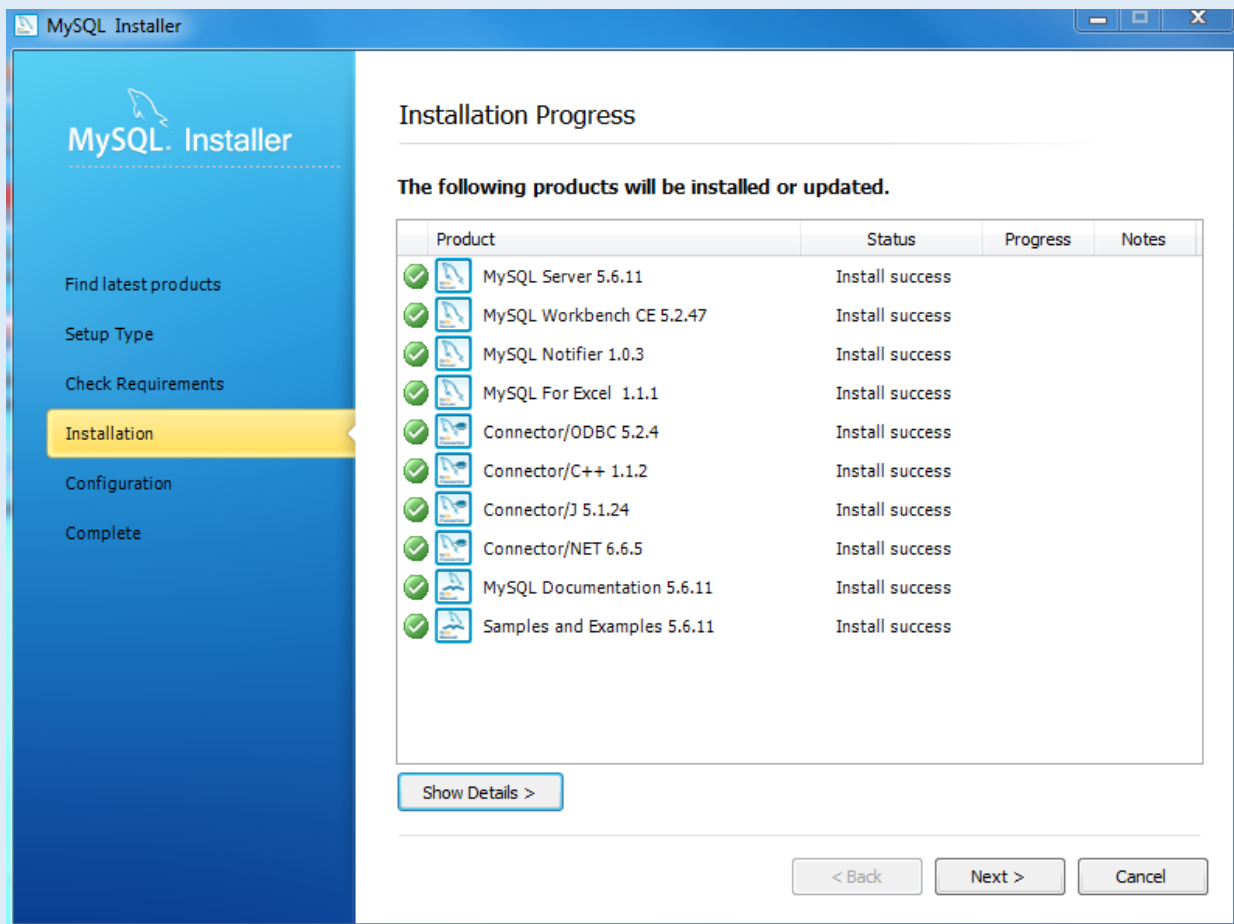

Install MySQL Step 7 – Installation Progress: MySQL Installer downloads all selected products. It will take a while, depending on which products that you selected and the speed of your internet connection.

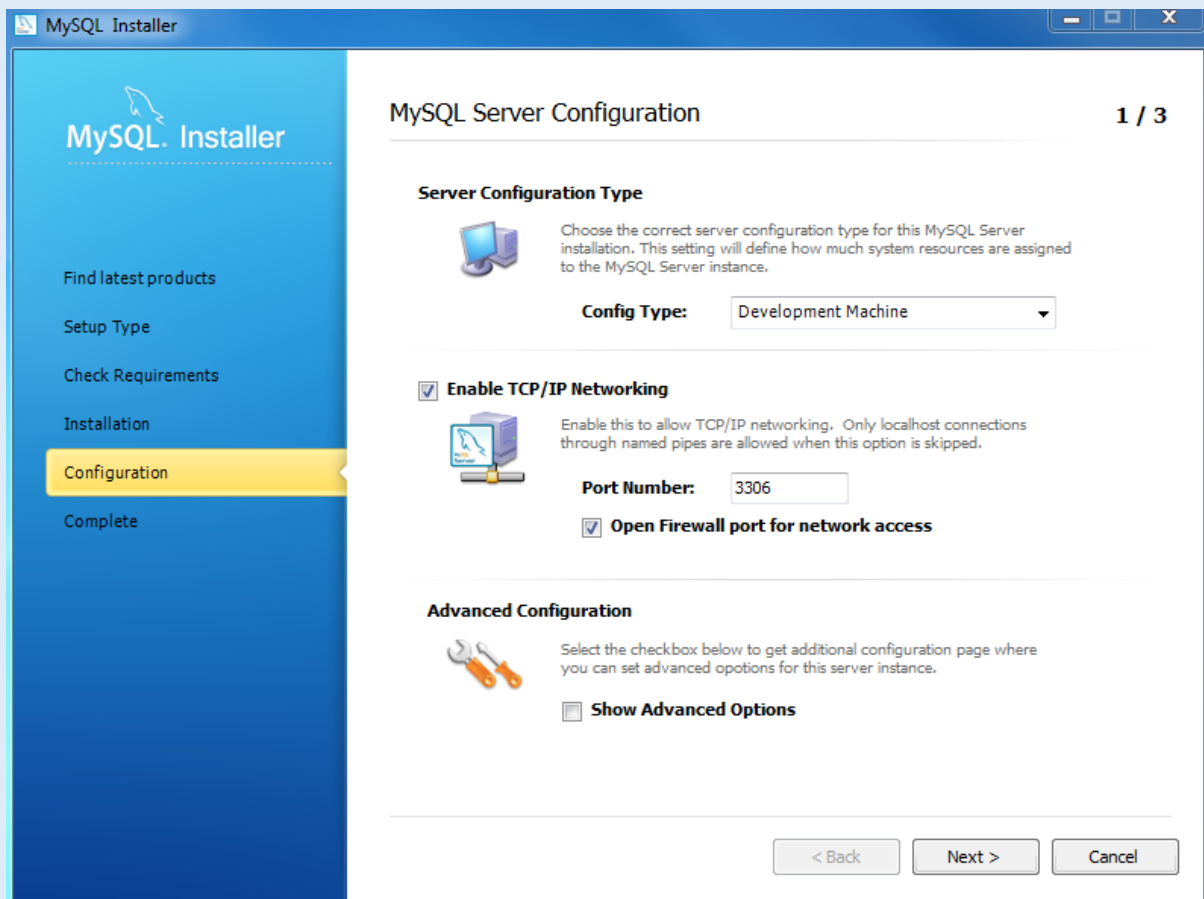

Install MySQL Step 7 – Installation Progress: downloading Products in progress.

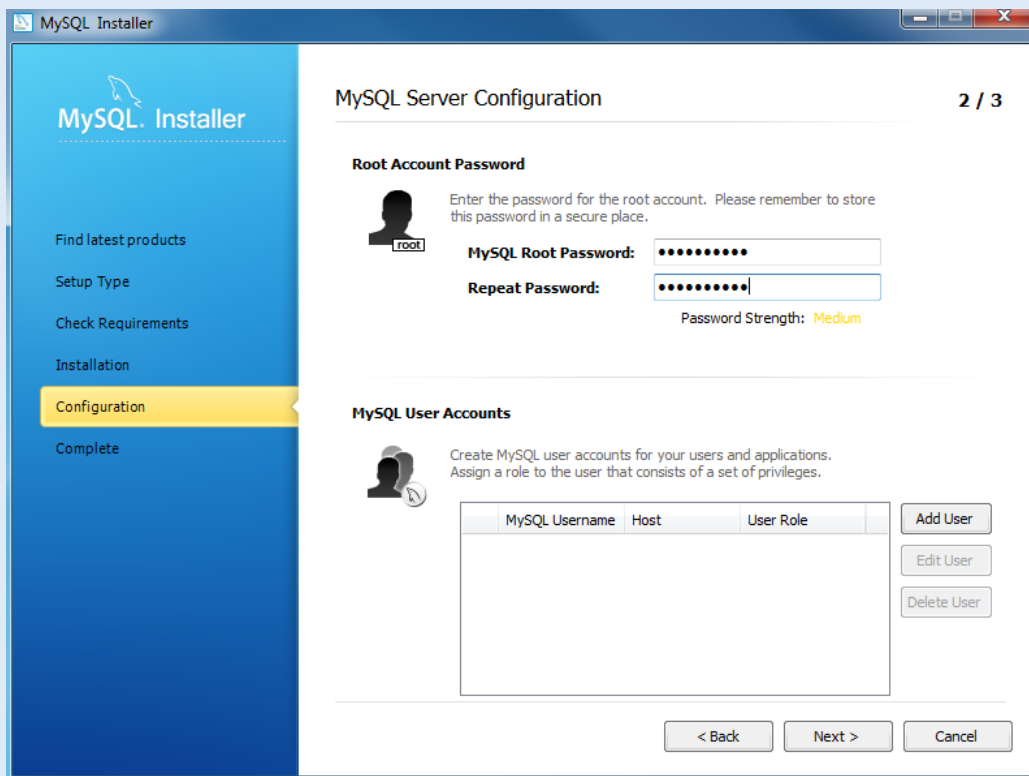

Install MySQL Step 7 – Installation Progress: Complete Downloading. Click Next button to continue...

Inst  
all

MySQL Step 8 – Configuration Overview. Click Next button to configure MySQL Database Server

Install MySQL Step 8.1 – MySQL Server Configuration: choose Config Type and MySQL port (3006 by default) and click Next button to continue.

The image shows the MySQL Installer window, specifically the 'MySQL Server Configuration' step (2 / 3). The left sidebar contains a navigation menu with options: 'Find latest products', 'Setup Type', 'Check Requirements', 'Installation', 'Configuration' (highlighted), and 'Complete'. The main area is divided into two sections. The first section, 'Root Account Password', prompts the user to enter a password for the root account, with a note to store it securely. It includes fields for 'MySQL Root Password' and 'Repeat Password', and a 'Password Strength' indicator showing 'Medium'. The second section, 'MySQL User Accounts', prompts the user to create MySQL user accounts and assign roles. It features a table with columns 'MySQL Username', 'Host', and 'User Role', and buttons for 'Add User', 'Edit User', and 'Delete User'. At the bottom, there are navigation buttons: '< Back', 'Next >', and 'Cancel'.

MySQL Installer

MySQL Server Configuration 2 / 3

**Root Account Password**

Enter the password for the root account. Please remember to store this password in a secure place.

MySQL Root Password:

Repeat Password:

Password Strength: Medium

**MySQL User Accounts**

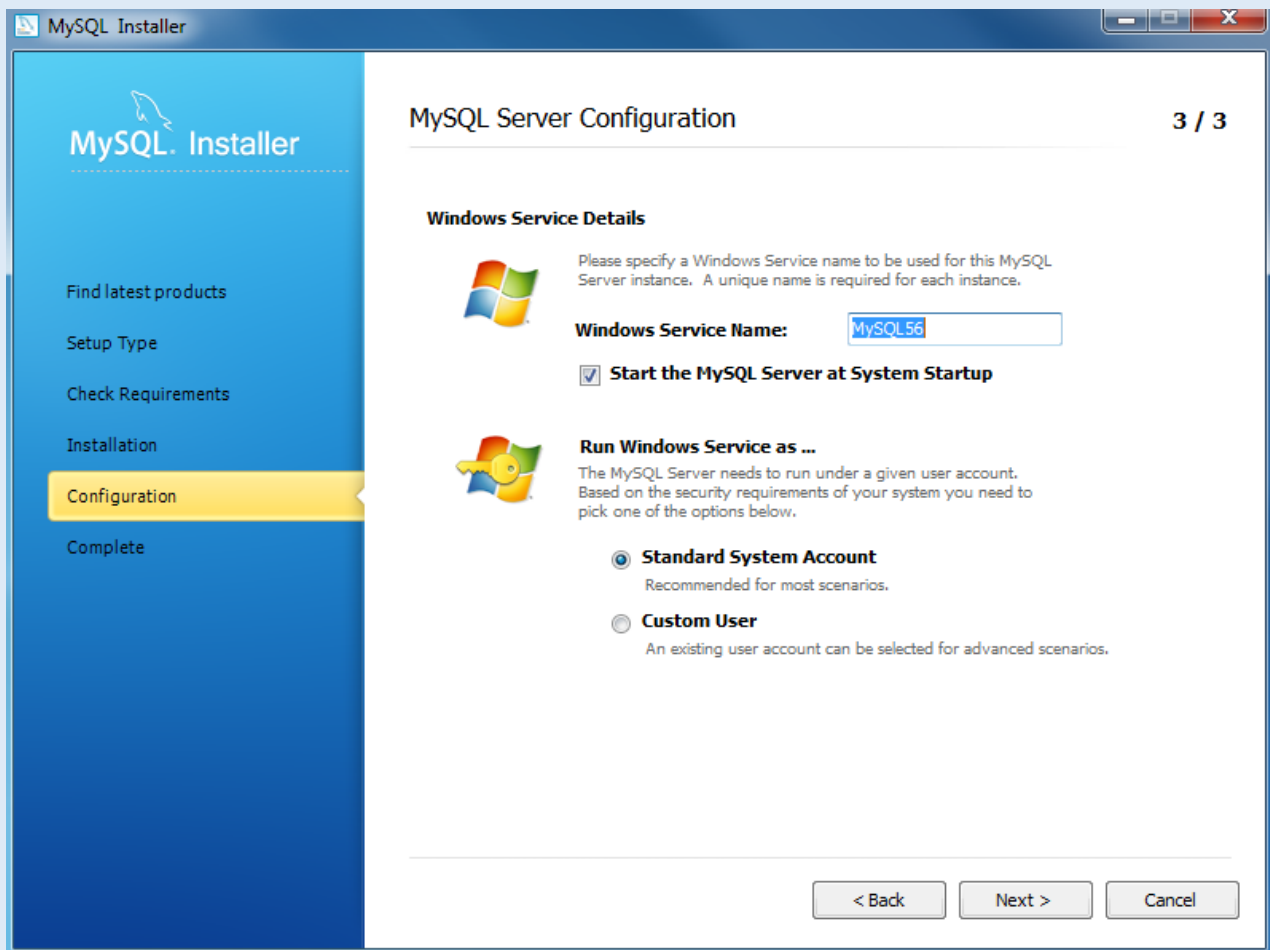

Create MySQL user accounts for your users and applications. Assign a role to the user that consists of a set of privileges.

MySQL Username	Host	User Role
----------------	------	-----------

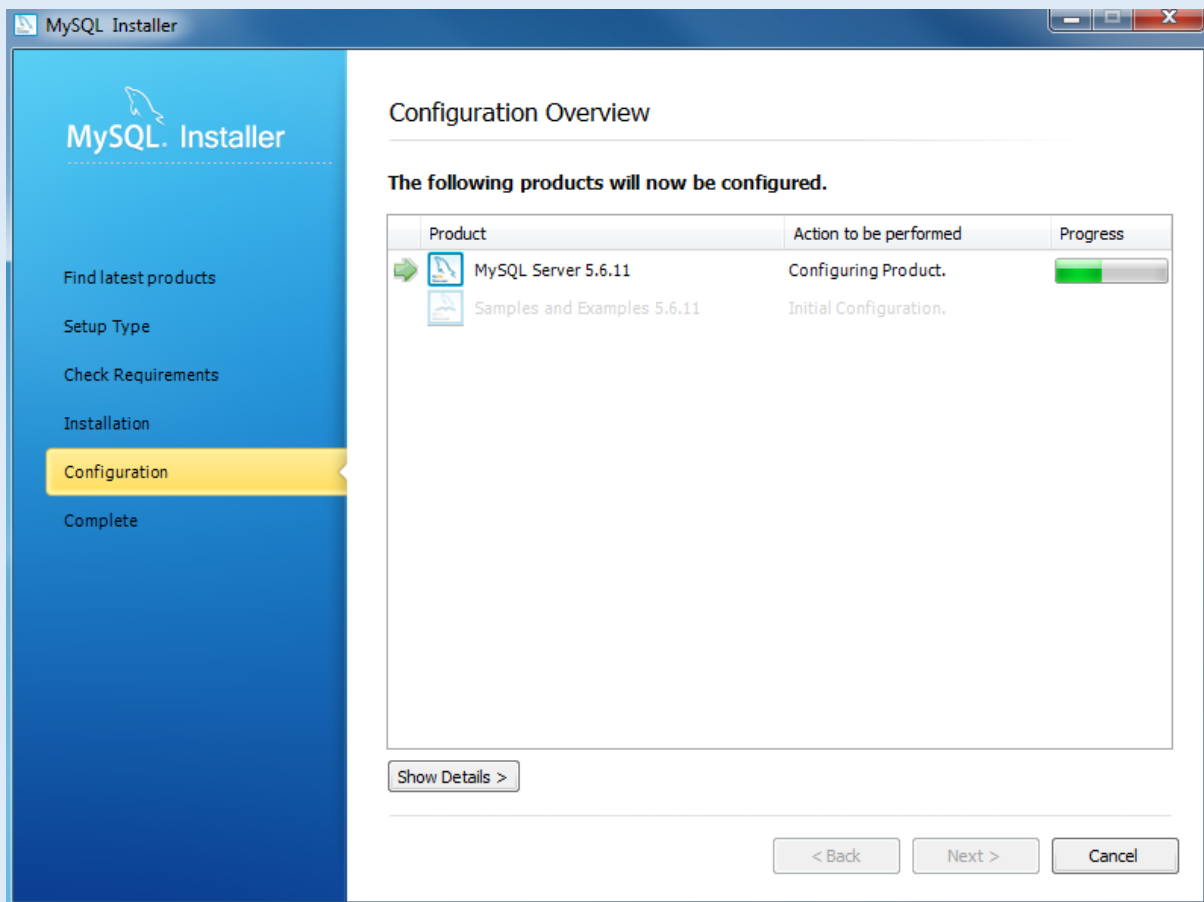

Add User  
Edit User  
Delete User

< Back Next > Cancel

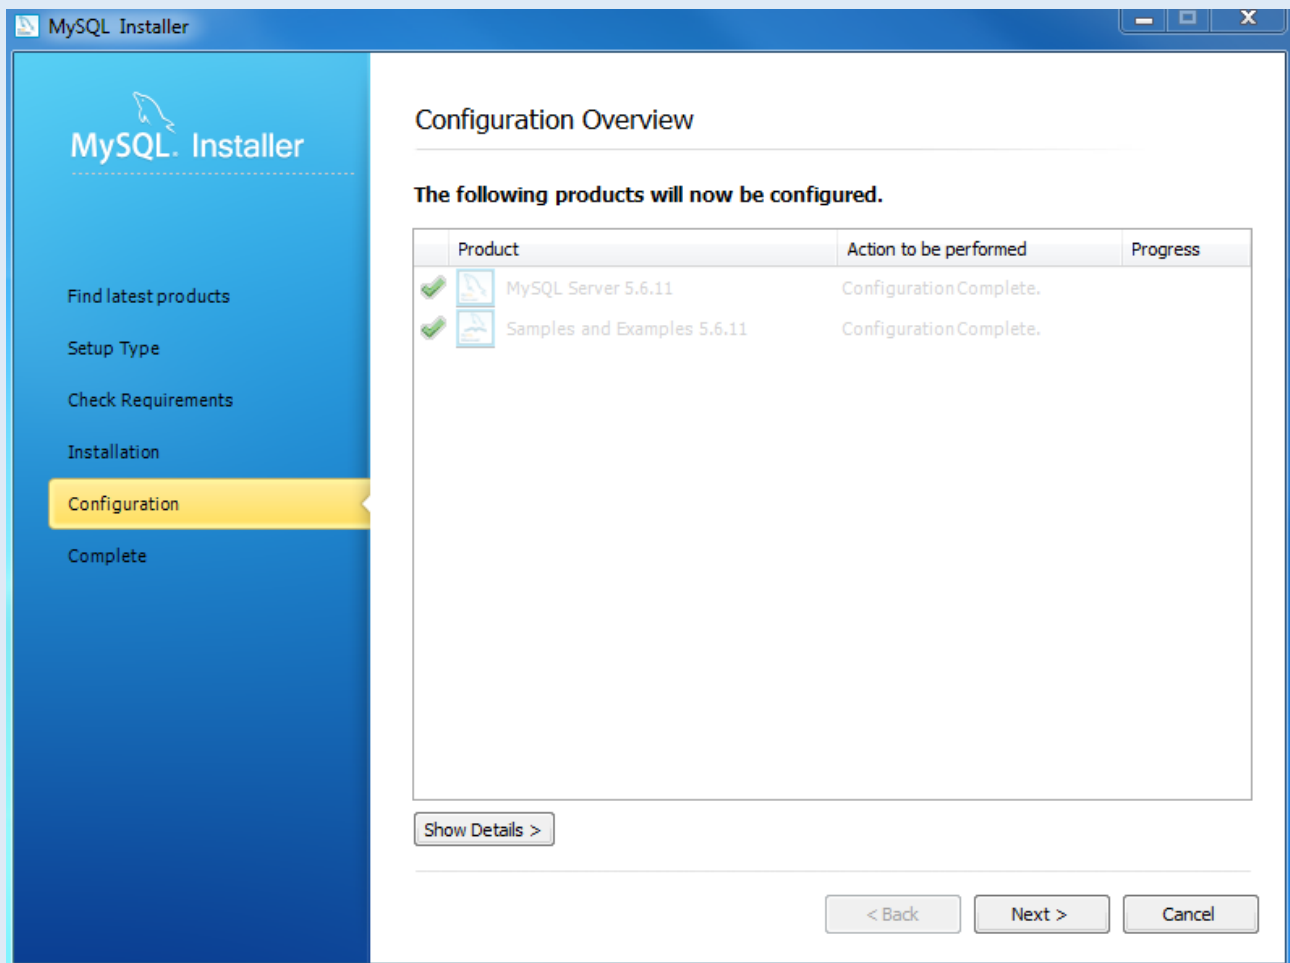

Install MySQL Step 8.1 – MySQL Server Configuration: choose a password for the root account. Please note the password download and keep it securely if you are installing MySQL database server on a production server. If you want to add a more MySQL user, you can do it in this step.

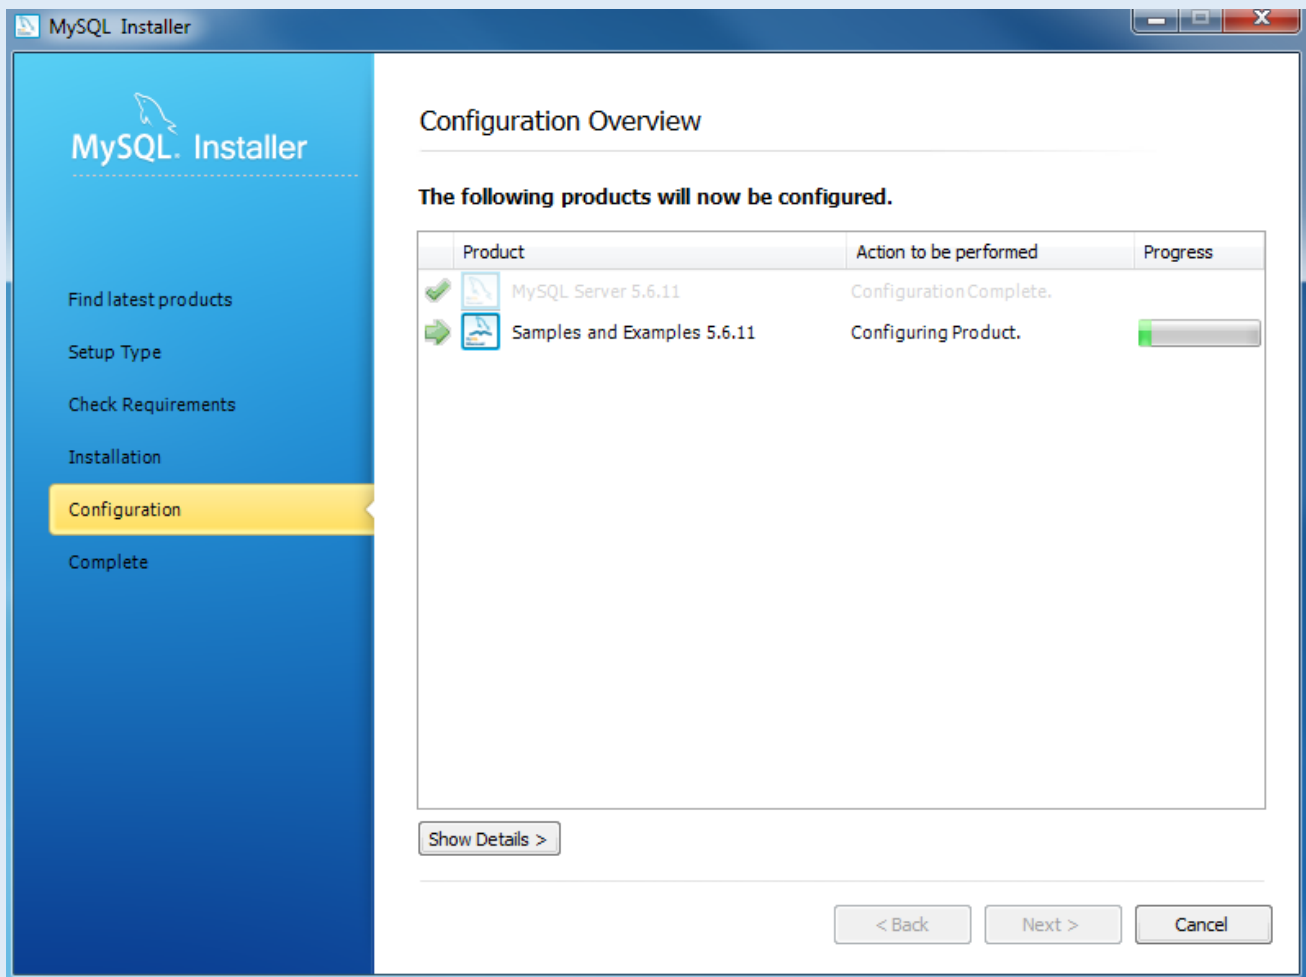

Install MySQL Step 8.1 – MySQL Server Configuration: choose Windows service details including Windows Service Name and account type, then click Next button to continue.

Install MySQL Step 8.1 – MySQL Server Configuration – In Progress: MySQL Installer is configuring MySQL database server. Wait until it is done and click Next button to continue.

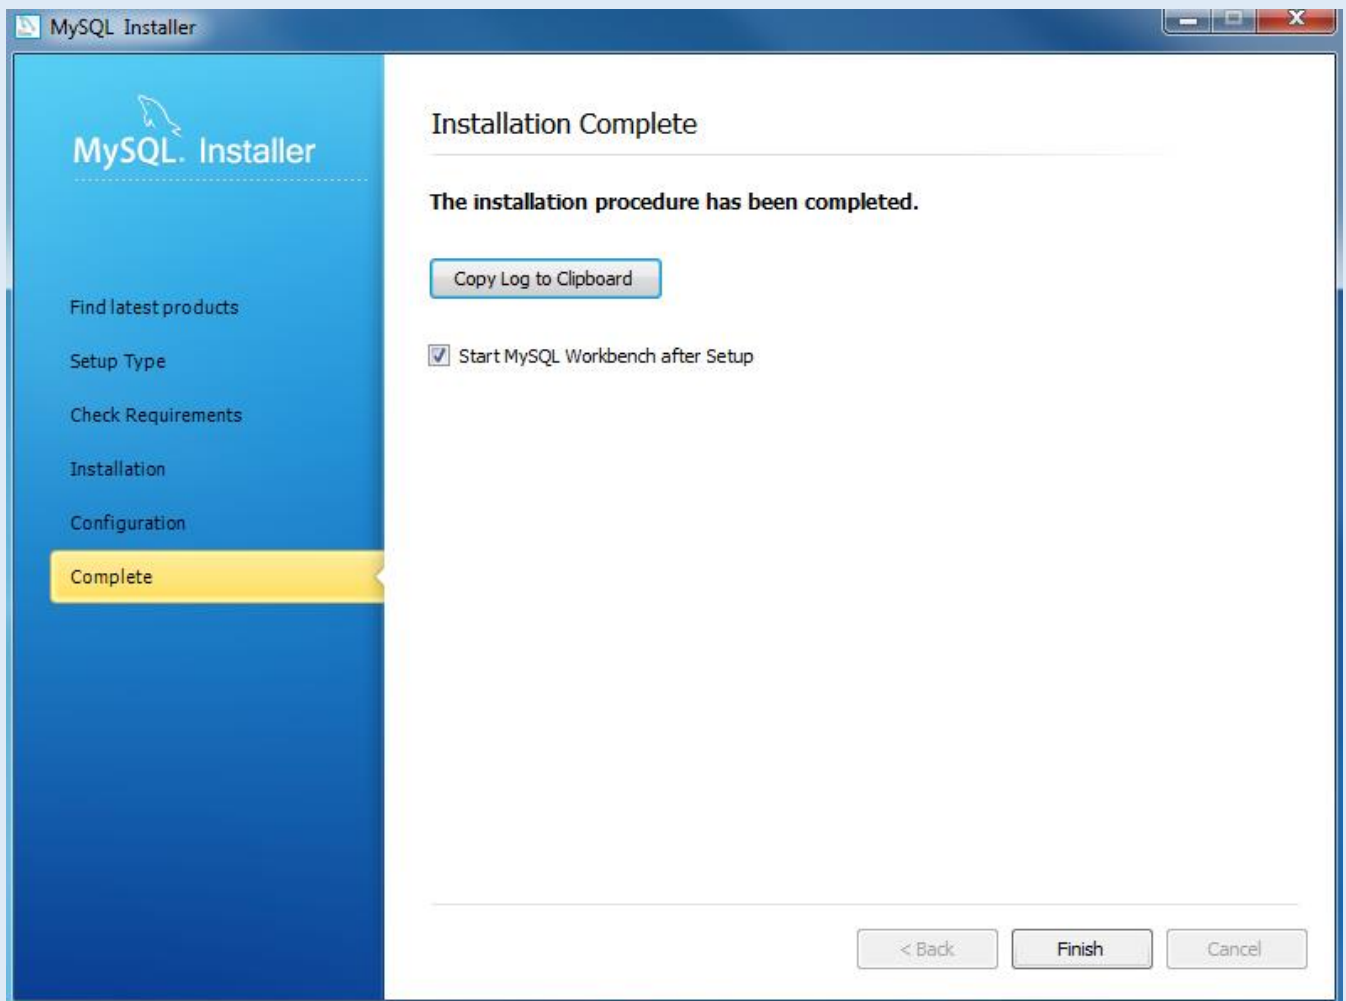

Install MySQL Step 8.1 – MySQL Server Configuration – Done. Click the Next button to continue.

Install MySQL Step 8.2 – Configuration Overview: MySQL Installer installs sample databases and sample models.

Install MySQL Step 9 – Installation Completes: the installation completes. Click finish button to close the installation wizard and launch the MySQL Workbench.

## ***Install Java***

The procedure to install Java broadly consists of:

Download and Install

Test Installation

» Windows System Requirements

Note: Installing Java requires that you can gain administrator access to Windows on your computer.

### **Download and Install**

This process requires you to download an executable file that includes all the files needed for the complete installation. You do not need to remain connected to the Internet during the installation. The file can also be copied to a computer that is not connected to the Internet.

Go to the Manual download page

Click on Windows Offline.

The File Download dialog box appears prompting you to run or save the download file

Click Save to download the file to your local system.

Tip: Save the file to a known location on your computer, for example, to your desktop.

Close all applications including the browser.

Double-click on the saved file to start the installation process.

The installation process starts. Click the Install button to accept the license terms and to continue with the installation.

Oracle has partnered with companies that offer various products. The installer may present you with option to install these programs when you install Java. After ensuring that the desired programs are selected, click the Next button to continue the installation.

A few brief dialogs confirm the last steps of the installation process; click Close on the last dialog. This will complete Java installation process.

**i** Detect older versions (8u20 and later versions). Starting with Java 8 Update 20 (8u20), on Windows systems, the Java Uninstall Tool is integrated with the installer to provide an option to remove older versions of Java from the system. The change is applicable to 32 bit and 64 bit Windows platforms.

Notifications about disabled Java and restoring prompts

The installer notifies you if Java content is disabled in web browsers, and provides instructions for enabling it. If you previously chose to hide some of the security prompts for applets and Java Web Start applications, the installer provides an option for restoring the prompts. The installer may ask you to reboot your computer if you chose not to restart an internet browser when it prompted you to do so

## II. For Linux

Introduction

[MySQL](#) is an open-source database management system, commonly installed as part of the popular [LAMP](#) (Linux, Apache, MySQL, PHP/Python/Perl) stack. It uses a relational database and SQL (Structured Query Language) to manage its data.

The short version of the installation is simple: update your package index, install the mysql-server package, and then run the included security script.

```
sudo apt-get update
```

```
sudo apt-get install mysql-server
```

```
mysql_secure_installation
```

This tutorial will explain how to install MySQL version 5.7 on a Ubuntu 16.04 server. However, if you're looking to update an existing MySQL installation to version 5.7, you can read [this MySQL 5.7 update guide](#) instead.

Prerequisites

To follow this tutorial, you will need:

One Ubuntu 16.04 server set up by following [this initial server setup guide](#), including a sudo non-

root user and a firewall.

### Step 1 — Installing MySQL

On Ubuntu 16.04, only the latest version of MySQL is included in the APT package repository by default. At the time of writing, that's MySQL 5.7

To install it, simply update the package index on your server and install the default package with apt-get.

```
sudo apt-get update
```

```
sudo apt-get install mysql-server
```

You'll be prompted to create a root password during the installation. Choose a secure one and make sure you remember it, because you'll need it later. Next, we'll finish configuring MySQL.

### Step 2 — Configuring MySQL

For fresh installations, you'll want to run the included security script. This changes some of the less secure default options for things like remote root logins and sample users. On older versions of MySQL, you needed to initialize the data directory manually as well, but this is done automatically now.

Run the security script.

```
mysql_secure_installation
```

This will prompt you for the root password you created in Step 1. You can press Y and then ENTER to accept the defaults for all the subsequent questions, with the exception of the one that asks if you'd like to change the root password. You just set it in Step 1, so you don't have to change it now. For a more detailed walkthrough of these options, you can see [this step of the LAMP installation tutorial](#).

To initialize the MySQL data directory, you would use `mysql_install_db` for versions before 5.7.6, and `mysqld --initialize` for 5.7.6 and later. However, if you installed MySQL from the Debian distribution, like in Step 1, the data directory was initialized automatically; you don't have to do anything. If you try running the command anyway, you'll see the following error:

Output

```
2016-03-07T20:11:15.998193Z 0 [ERROR] --initialize specified but the data directory has files in it. Aborting.
```

Finally, let's test the MySQL installation.

### Step 3 — Testing MySQL

Regardless of how you installed it, MySQL should have started running automatically. To test this, check its status.

```
systemctl status mysql.service
```

You'll see output similar to the following:

Output

#### ● mysql.service - MySQL Community Server

Loaded: loaded (/lib/systemd/system/mysql.service; enabled; vendor preset: en

Active: active (running) since Wed 2016-11-23 21:21:25 UTC; 30min ago

Main PID: 3754 (mysqld)

Tasks: 28

Memory: 142.3M

CPU: 1.994s

CGroup: /system.slice/mysql.service

└─3754 /usr/sbin/mysqld

If MySQL isn't running, you can start it with `sudo systemctl start mysql`.

For an additional check, you can try connecting to the database using the mysqladmin tool, which is a client that lets you run administrative commands. For example, this command says to connect to MySQL as root (-u root), prompt for a password (-p), and return the version.

```
mysqladmin -p -u root version
```

You should see output similar to this:

Output

```
mysqladmin Ver 8.42 Distrib 5.7.16, for Linux on x86_64  
Copyright (c) 2000, 2016, Oracle and/or its affiliates. All rights reserved.
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

```
Server version      5.7.16-0ubuntu0.16.04.1  
Protocol version    10  
Connection          Localhost via UNIX socket  
UNIX socket         /var/run/mysqld/mysqld.sock  
Uptime:             30 min 54 sec
```

```
Threads: 1 Questions: 12 Slow queries: 0 Opens: 115 Flush tables: 1 Open tables: 34 Queries  
per second avg: 0.006
```

This means MySQL is up and running.

## Install Java on Linux

The instructions below are for installing version Java 8 Update 73 (8u73). If you are installing another version, make sure you change the version number appropriately when you type the commands at the terminal. Example: For Java 8u79 replace 8u73 with 8u79. Note that, as in the preceding example, the version number is sometimes preceded with the letter u, and sometimes it is preceded with an underbar, for example, jre1.8.0\_73.

Note about root access: To install Java in a system-wide location such as /usr/local, you must login as the root user to gain the necessary permissions. If you do not have root access, install Java in your home directory or a subdirectory for which you have write permissions.

Change to the directory in which you want to install. Type:

```
cd directory_path_name
```

For example, to install the software in the /usr/java/ directory, Type:

```
cd /usr/java/
```

Move the .tar.gz archive binary to the current directory.

Unpack the tarball and install Java

```
tar zxvf jre-8u73-linux-x64.tar.gz
```

The Java files are installed in a directory called jre1.8.0\_73 in the current directory. In this example, it is installed in the /usr/java/jre1.8.0\_73 directory. When the installation has completed, you will see the word Done.

Delete the .tar.gz file if you want to save disk space.

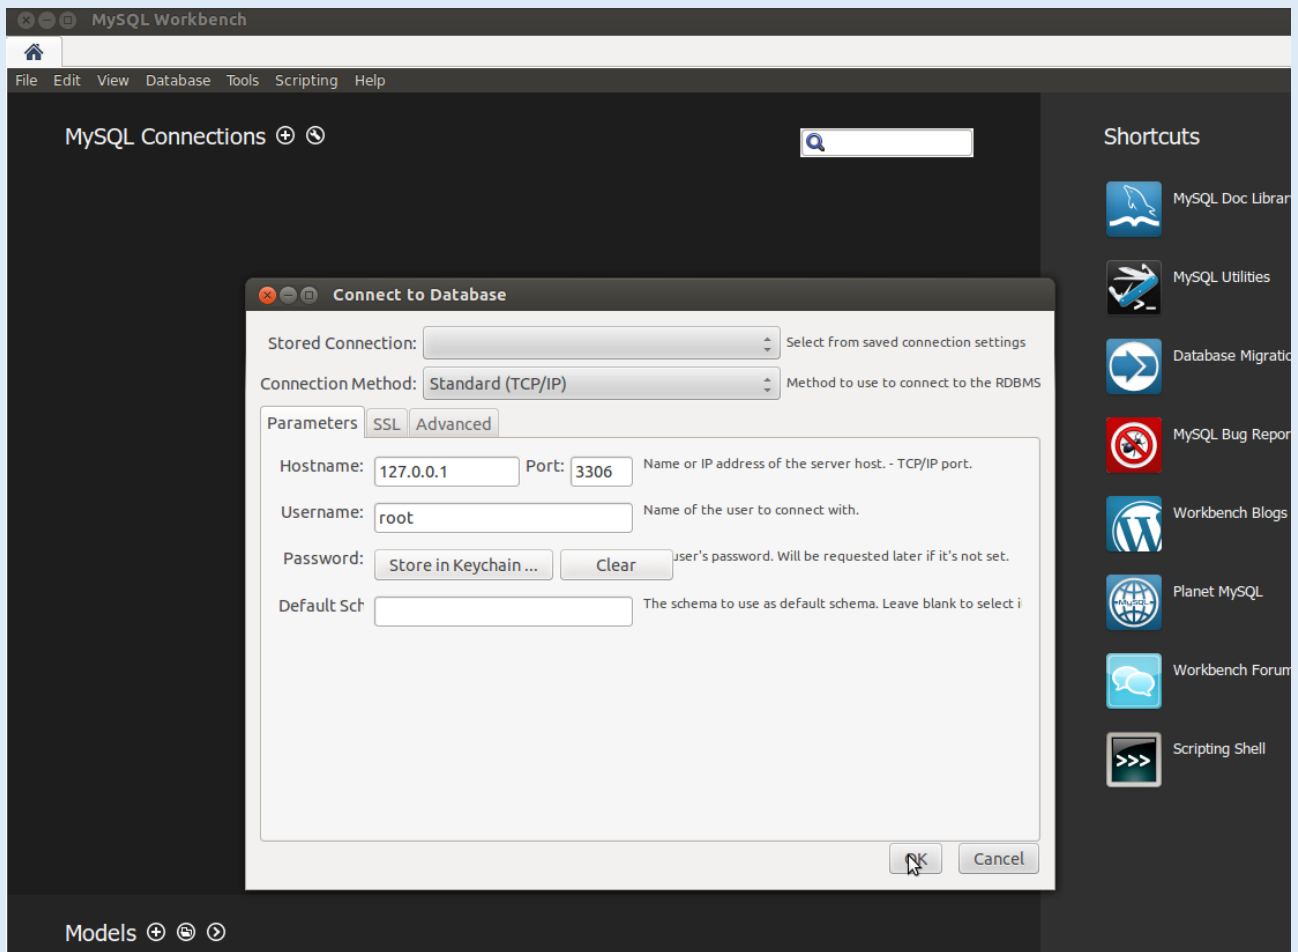

## B . ATTACH DATABASE AND DEPLOY WEBSITE

### I. Attach Database

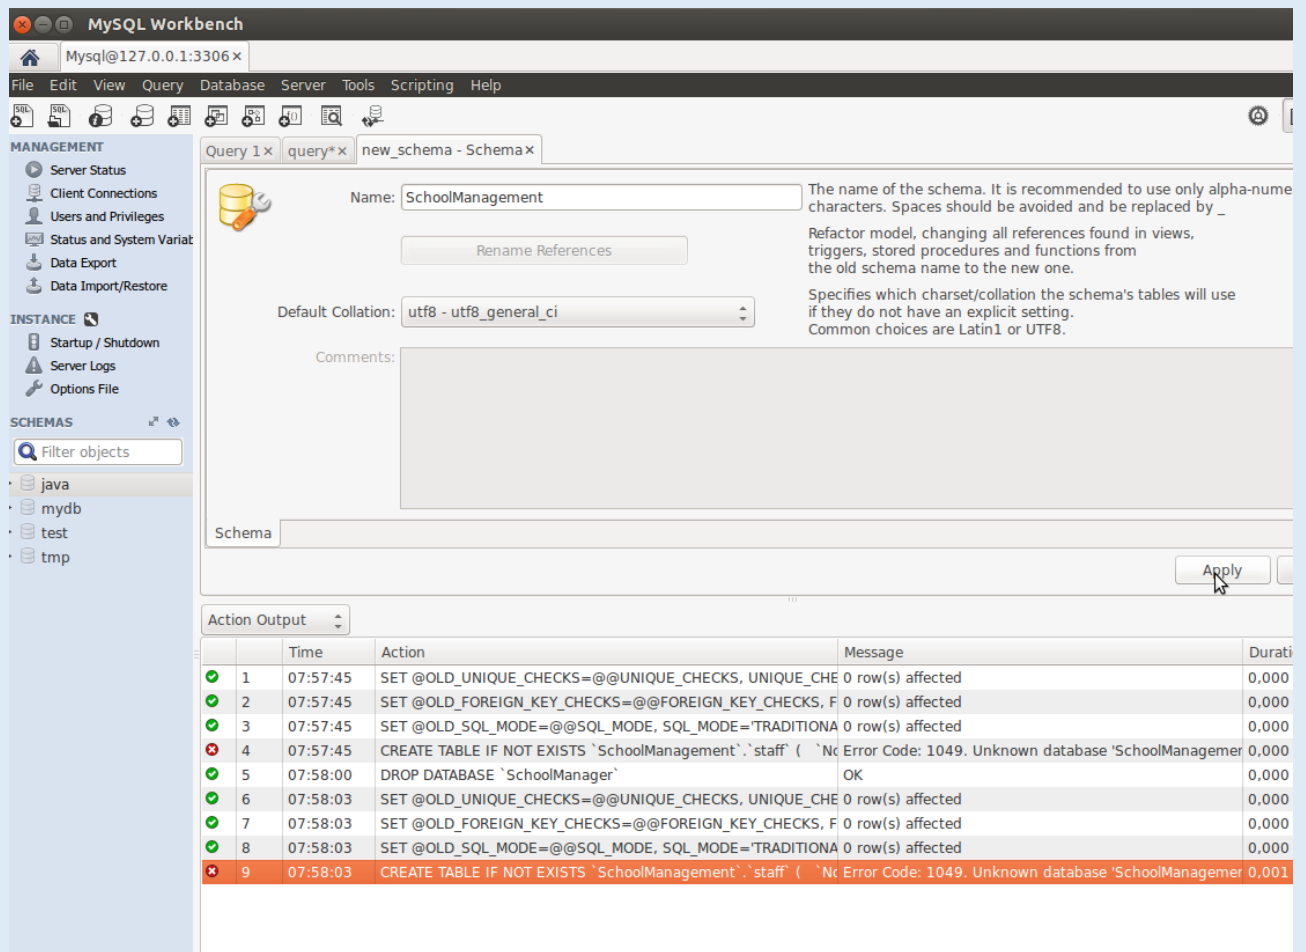

Open MySQL WorkBench

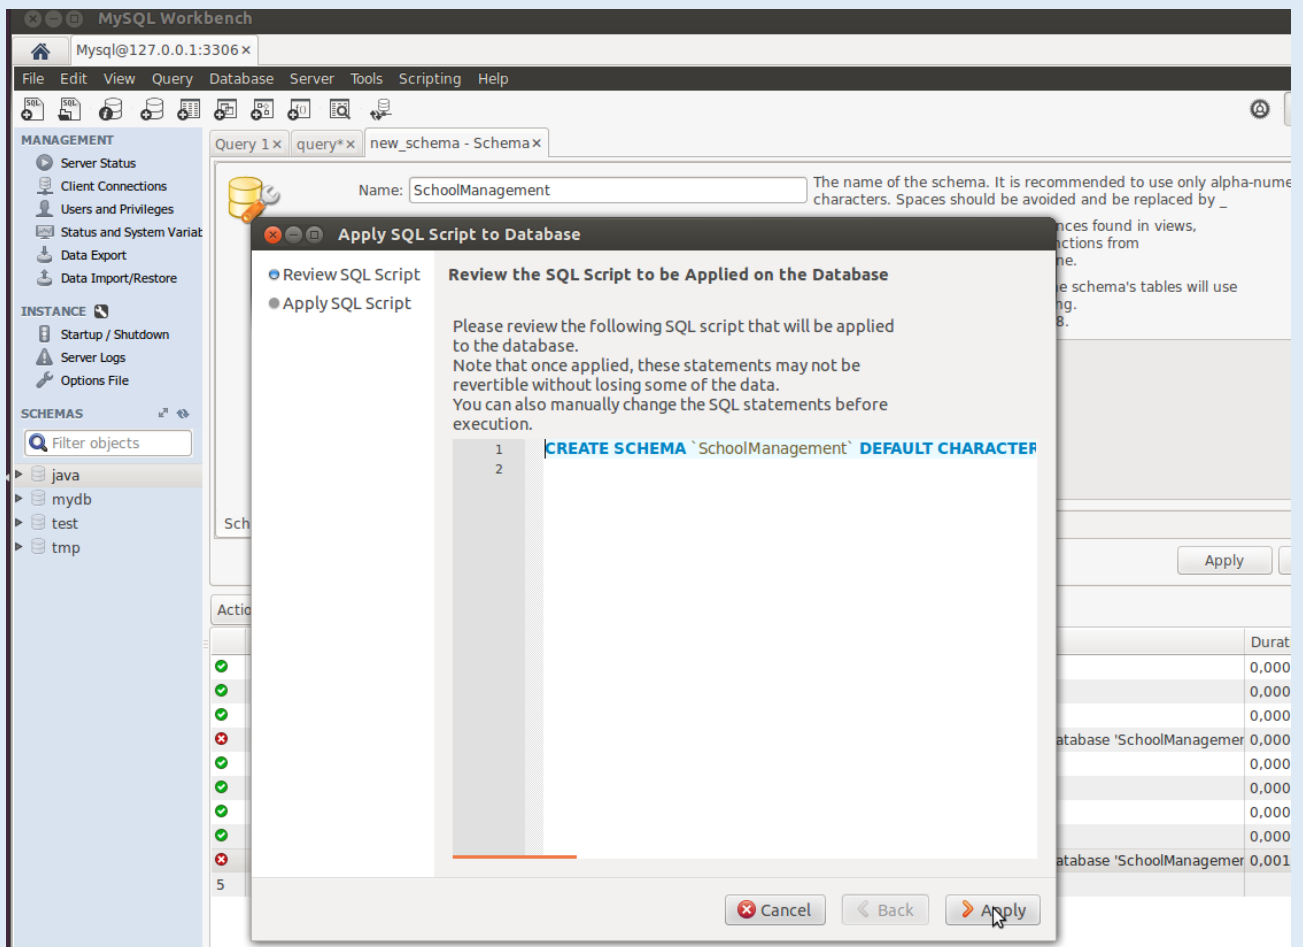

## Connect database

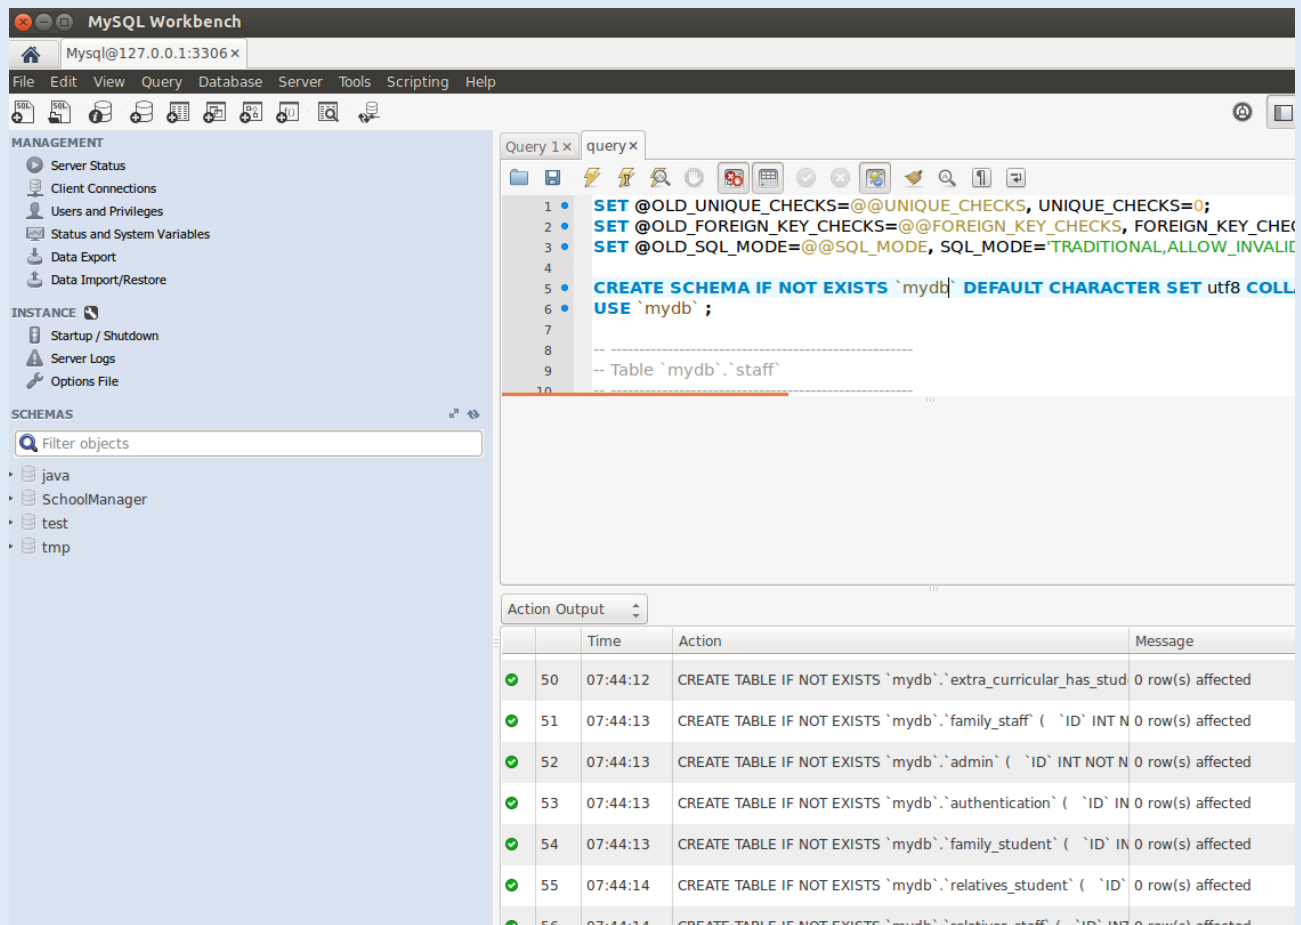

## Create new schema (database)

## Add query.sql

The screenshot shows the MySQL Workbench interface. The left sidebar contains the 'MANAGEMENT' and 'SCHEMAS' panels. The 'SCHEMAS' panel shows a list of databases: java, SchoolManager, test, and tmp. The main window displays a SQL query in the 'Query 1 x' tab. The query is as follows:

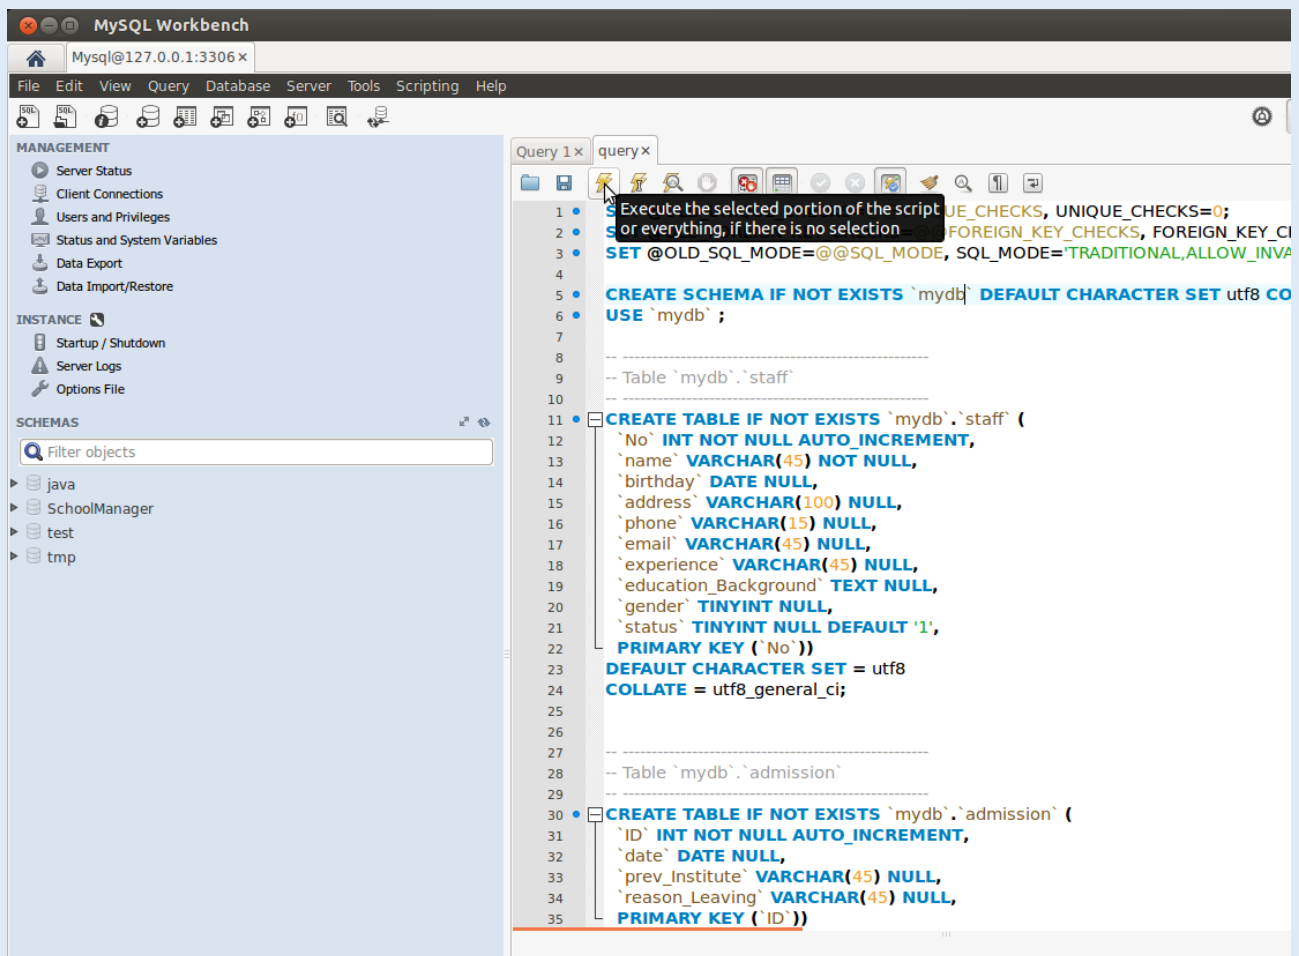

```

1 • SET @OLD_UNIQUE_CHECKS=@@UNIQUE_CHECKS, UNIQUE_CHECKS=0;
2 • SET @OLD_FOREIGN_KEY_CHECKS=@@FOREIGN_KEY_CHECKS, FOREIGN_KEY_CHECKS=0;
3 • SET @OLD_SQL_MODE=@@SQL_MODE, SQL_MODE='TRADITIONAL,ALLOW_INVALID_TEMPLATES';
4
5 • CREATE SCHEMA IF NOT EXISTS `mydb` DEFAULT CHARACTER SET utf8 COLLATE utf8_general_ci;
6 • USE `mydb`;
7
8
9 -- Table `mydb`.`staff`
10

```

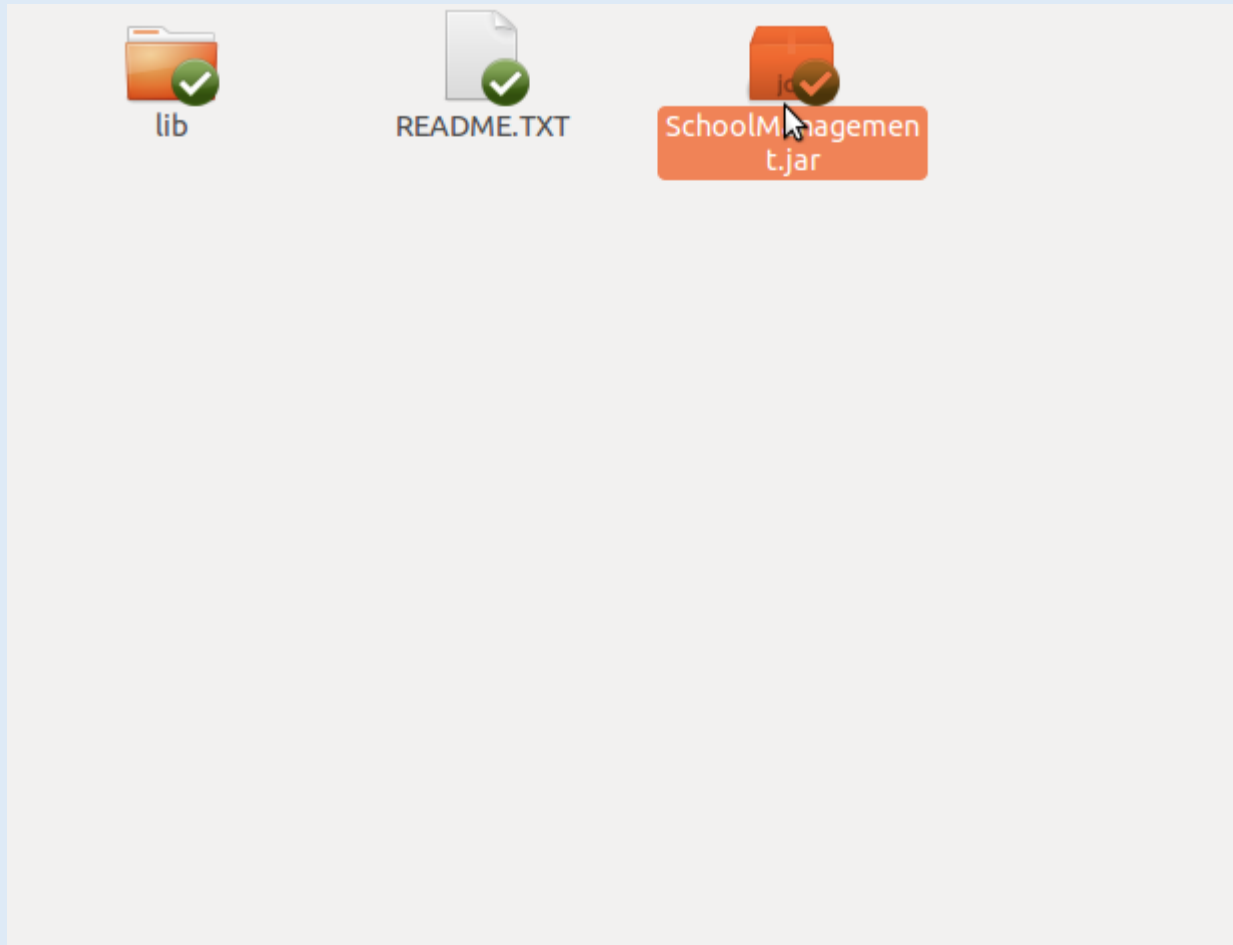

The 'Action Output' table at the bottom shows the results of the execution:

	Time	Action	Message
✓	50	07:44:12	CREATE TABLE IF NOT EXISTS `mydb`.`extra_curricular_has_stud` 0 row(s) affected
✓	51	07:44:13	CREATE TABLE IF NOT EXISTS `mydb`.`family_staff` ( `ID` INT NOT NULL) 0 row(s) affected
✓	52	07:44:13	CREATE TABLE IF NOT EXISTS `mydb`.`admin` ( `ID` INT NOT NULL) 0 row(s) affected
✓	53	07:44:13	CREATE TABLE IF NOT EXISTS `mydb`.`authentication` ( `ID` INT NOT NULL) 0 row(s) affected
✓	54	07:44:13	CREATE TABLE IF NOT EXISTS `mydb`.`family_student` ( `ID` INT NOT NULL) 0 row(s) affected
✓	55	07:44:14	CREATE TABLE IF NOT EXISTS `mydb`.`relatives_student` ( `ID` INT NOT NULL) 0 row(s) affected
✓	56	07:44:14	CREATE TABLE IF NOT EXISTS `mydb`.`relatives_staff` ( `ID` INT NOT NULL) 0 row(s) affected

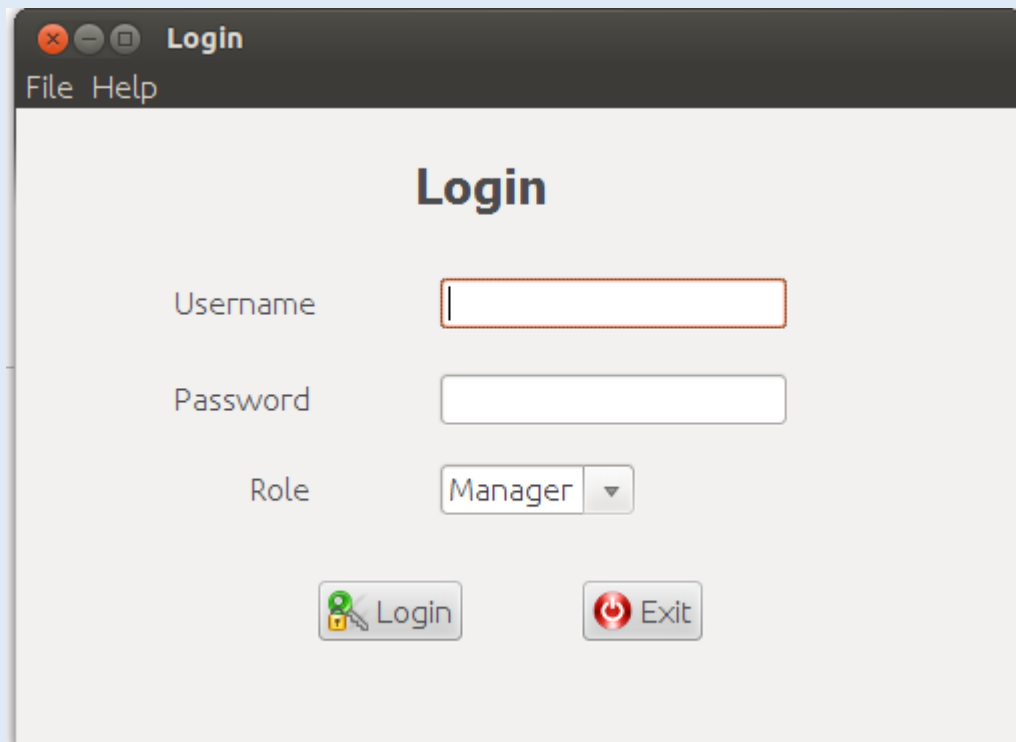

## II. Config Application for first time

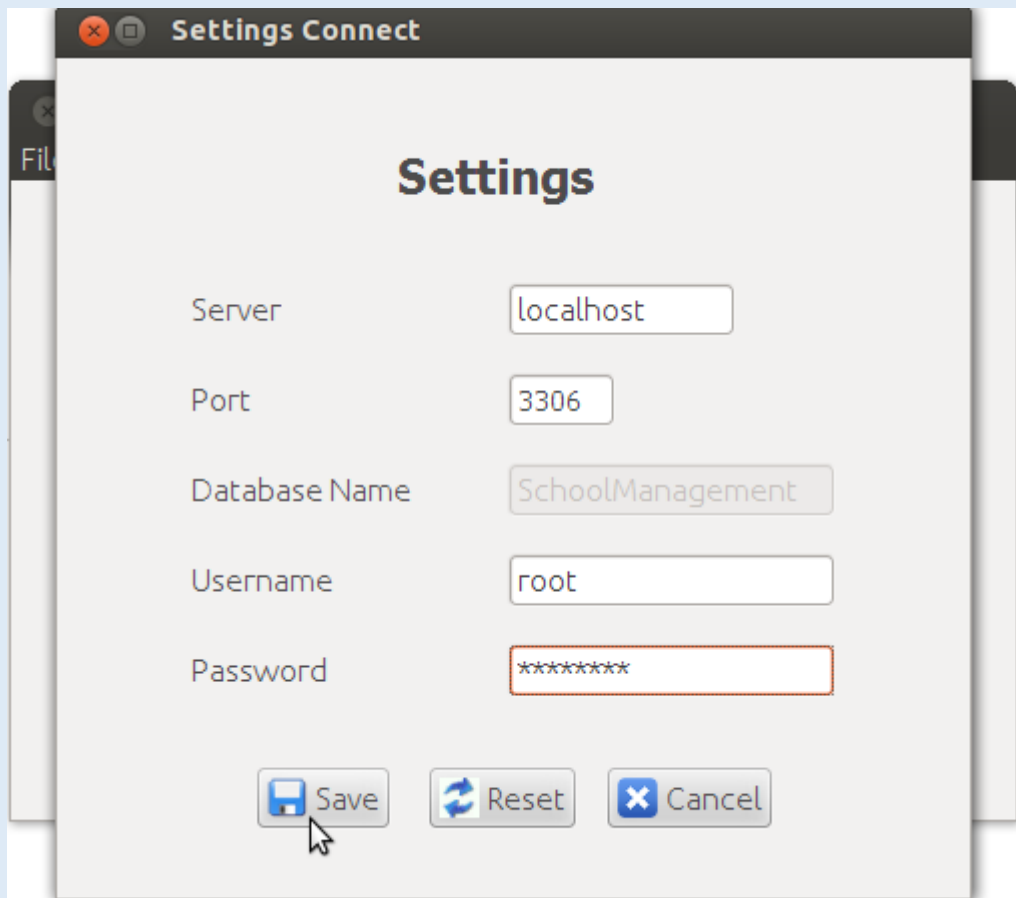

Run Application

## Settings

The Login window has a title bar with 'Login' and a menu bar with 'File' and 'Help'. The main content area is titled 'Login' and contains three input fields: 'Username' (a text box), 'Password' (a text box), and 'Role' (a dropdown menu with 'Manager' selected). At the bottom, there are two buttons: 'Login' (with a green key icon) and 'Exit' (with a red power icon).

The Settings Connect window has a title bar with 'Settings Connect' and a menu bar with 'File'. The main content area is titled 'Settings' and contains five input fields: 'Server' (text box with 'localhost'), 'Port' (text box with '3306'), 'Database Name' (text box with 'SchoolManagement'), 'Username' (text box with 'root'), and 'Password' (text box with '\*\*\*\*\*'). At the bottom, there are three buttons: 'Save' (with a blue floppy disk icon), 'Reset' (with a blue circular arrow icon), and 'Cancel' (with a blue 'X' icon). A mouse cursor is pointing at the 'Save' button.
